

**IN THE CLAIMS:**

No changes have been made to the claims, however, the claims are provided below for the convenience of the Examiner:

1. (Previously Presented) A pointing device that can be operated to move an operational object on a display screen in any 360-degree direction, comprising:

a control unit for changing an operation mode of said pointing device according to contents displayed on said display screen at the time said pointing device is operated,

wherein said control unit determines a direction in which said operational object can be moved on said display screen according to said operation mode, and defines the direction in advance in which said operational object can be moved on said display screen, as a current direction in which said pointing device can be operated.

2-4. (Canceled).

5. (Original) A pointing device according to claim 1, wherein said control unit has moving amount adjusting means for moving said operational object by a predetermined step value when said pointing device is operated.

6-8. (Canceled).

9. (Original) A pointing device according to claim 5, wherein said moving amount adjusting means move said operational object by the predetermined step value when the amount of operation of said pointing device takes the maximum value.

10. (Original) A pointing device according to claim 5, wherein said moving amount adjusting means move said operational object by the predetermined step value when the amount of operation of said pointing device exceeds a predetermined threshold value.

11-16. (Canceled).

17. (Original) A mobile telephone comprising a pointing device according to claim 1.

18. (Canceled).

19. (Original) A mobile telephone comprising a pointing device according to claim 5.
20. (Original) A mobile telephone according to claim 17, wherein said control unit is constituted in a main control unit of said mobile telephone.
21. (Canceled).
22. (Original) A mobile telephone according to claim 19, wherein said control unit is constituted in a main control unit of said mobile telephone.
23. (Previously Presented) A method for controlling a pointing device that can be operated to move an operational object on a display screen in any 360-degree direction, comprising the controlling step of:  
changing an operational mode of said pointing device in advance according to contents displayed on said display screen at the time said pointing device is operated,  
wherein in said controlling step, a direction in which said operational object can be moved on said display screen is determined according to said operation mode, and said direction in which said operational object can be moved on said display screen is defined as a current direction in which said pointing device can be operated.
24. (Original) A method for controlling a pointing device according to claim 23, wherein the pointing device can be operated to move said operational object at any speed, and wherein said controlling step has the moving amount adjusting step of moving said operational object by a predetermined step value when said pointing device is operated.
25. (Previously Presented) A mobile telephone, comprising:  
a pointing device that can be operated to move an operational object on a display screen in any 360-degree direction,  
a control unit for changing an operation mode in advance of said pointing device according to contents displayed on said display screen at the time said pointing device is operated,  
wherein said control unit determines a direction in which said operational object can be moved on said display screen according to said operation mode, and defines the direction in

which said operational object can be moved on said display screen, as a current direction in which said pointing device can be operated.

26. (Previously Presented) A mobile telephone according to claim 25, wherein said control unit has moving amount adjusting means for moving said operational object by a predetermined step value when said pointing device is operated.

27. (Previously Presented) A mobile telephone according to claim 26, wherein said moving amount adjusting means move said operational object by the predetermined step value when the amount of operation of said pointing device takes the maximum value.

28. (Previously Presented) A mobile telephone according to claim 27, wherein said moving amount adjusting means move said operational object by the predetermined step value when the amount of operation of said pointing device exceeds a predetermined threshold value.

29. (Previously Presented) A mobile telephone according to claim 25, wherein said control unit is constituted in a main control unit of said mobile telephone.
